

Vertical Multistage Pumps: Introduction of rubber pins on aluminum couplings for 3 and 4 kW motors

Franklin Electric continuously develops its products to optimize them for changing market conditions. To improve the application with Variable Frequency Drives, Franklin Electric introduces rubber pins (shown in green on the picture below) on aluminum couplings for systems with 3 kW and 4 kW motors, frame MEC 100/112.

This modification will be effective from the next shipment for all EV pumps, pump ends and pumps and motors mounted with 3 kW and 4 kW motors.

The prices will not change. For further technical or commercial information, please contact your commercial or marketing contact at Franklin Electric / E-Tech.
